Concepts to be familiar with before reading this document

7X : "not X"

"proposition"

If P is a proposition then so is 7P.

Any proposition is either true (T) or false (F)

If P is a proposition then so is 7P.

Any proposition is either true (T) or false (F)

but P and 7P can't both be T, or both F.

If P is a proposition then so is 7P.

Any proposition is either true (T) or false (F)

but P and 7P can't both be T, or both F.

If we know one, we know the other

P 7P
T F
T

Recall: "it's raining" and "it's cloudy" are not propositions. - can vary

Reca	l(: '	"it's	raining"	and	"it's	cloudy"	are not propos	sitions can vary
								It's always true.

"if it's raining then it's not cloudy" is a proposition. It's always false.

Recall: "it's raining" and "it's cloudy" are not propositions. \(\subseteq \can vary \)
"if it's raining then it's cloudy" is a proposition. It's always true.

"if it's raining then it's not cloudy" is a proposition. It's always false.

P = "it's raining"

Q = "it's cloudy"

P&Q are Boolean variables

Recall: "it's raining" and "it's cloudy" are not propositions. - can vary "if it's raining then it's cloudy" is a proposition. It's always true. "if it's raining then it's not cloudy" is a proposition. It's always talse.

P = "it's raining" Q = "it's cloudy" P&Q are Boolean variables

George Boole, 1840's

Recall: "it's raining" and "it's cloudy" are not propositions. — can vary "if it's raining then it's cloudy" is a proposition. It's always true. "if it's raining then it's not cloudy" is a proposition. It's always false.

P = "it's raining" Q = "it's cloudy"

P&Q are Boolean variables aka propositional variables that can be used in other statements, e.g., (P AND Q)

"it is raining and cloudy"

Recall: "it's raining" and "it's cloudy" are not propositions. - can vary "if it's raining then it's cloudy" is a proposition. It's always true. "if it's raining then it's not cloudy" is a proposition. It's always talse. Example:

If it doesn't matter / apply, why bother considering these cases?

If it doesn't matter/apply, why bother considering these cases?
It is often important to simplify statements with Boolean variables

Example coming soon

Example 2:

fly (F)

if pigs can fly then I like apples

P o Q: This is true! (when P is F)

if pigs can fly then I like apples

It doesn't matter if I like apples

Example 2:

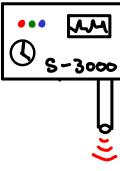

P -> Q: This is true! (when Q is T)

if I life on Mars then I like basketball

It doesn't matter if there is life on Mars

A machine has a sensor that sets 2 variables.

P

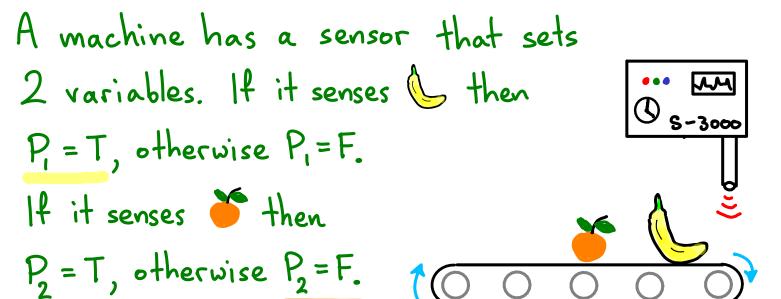

P

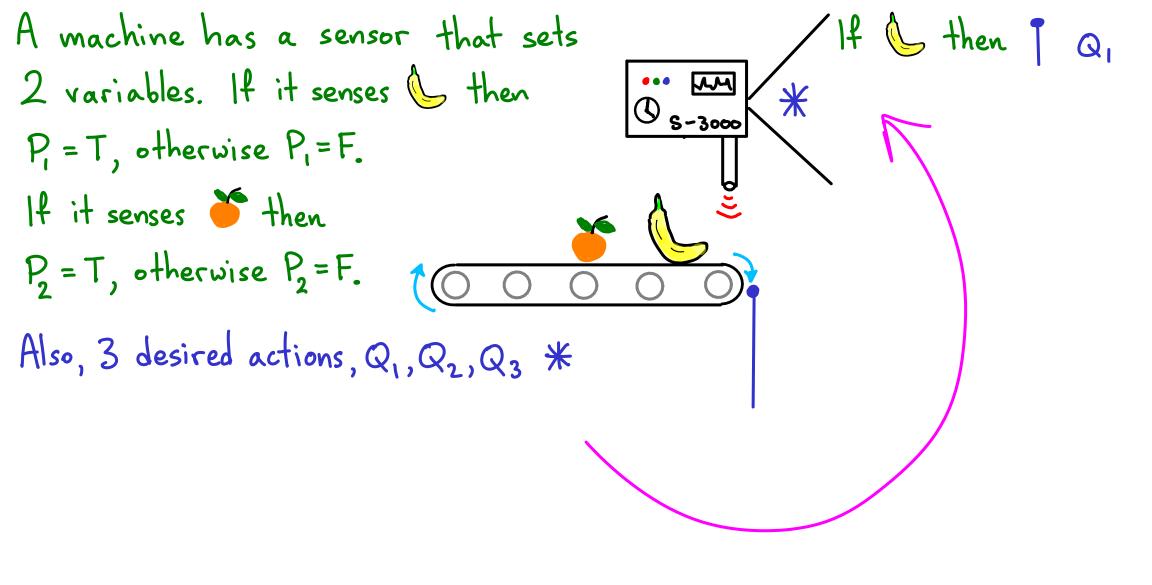

A machine has a sensor that sets

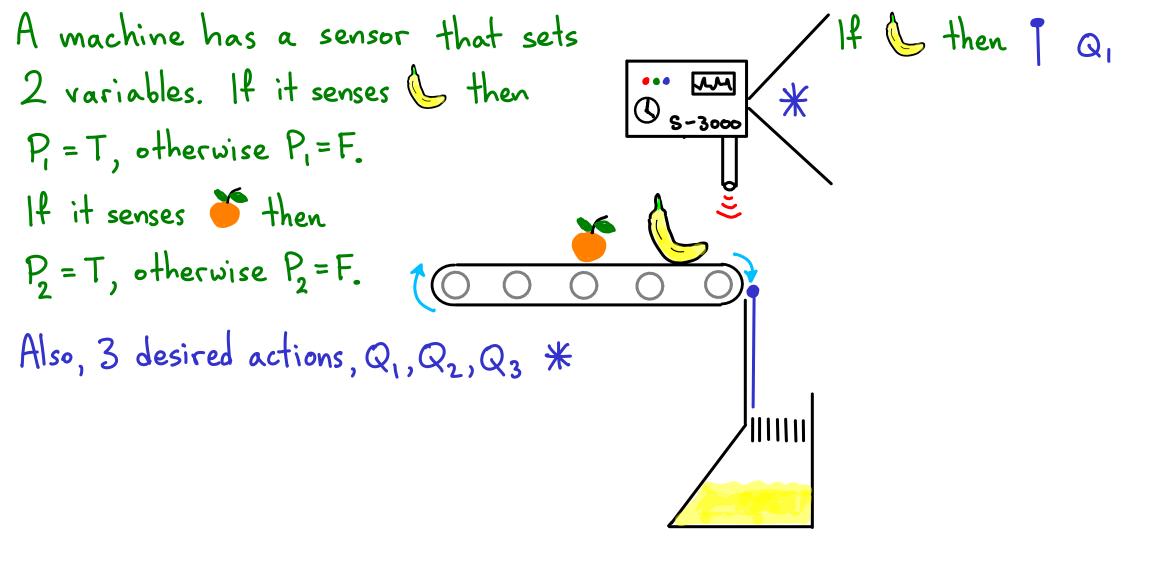

2 variables. If it senses then

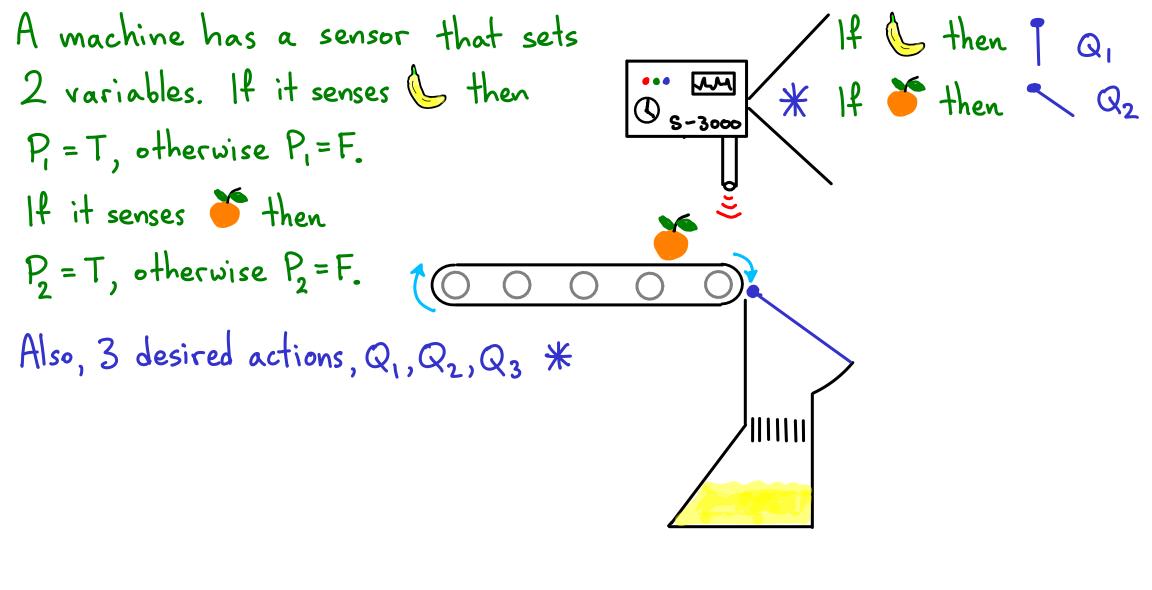

P₁ = T, otherwise P₁ = F.

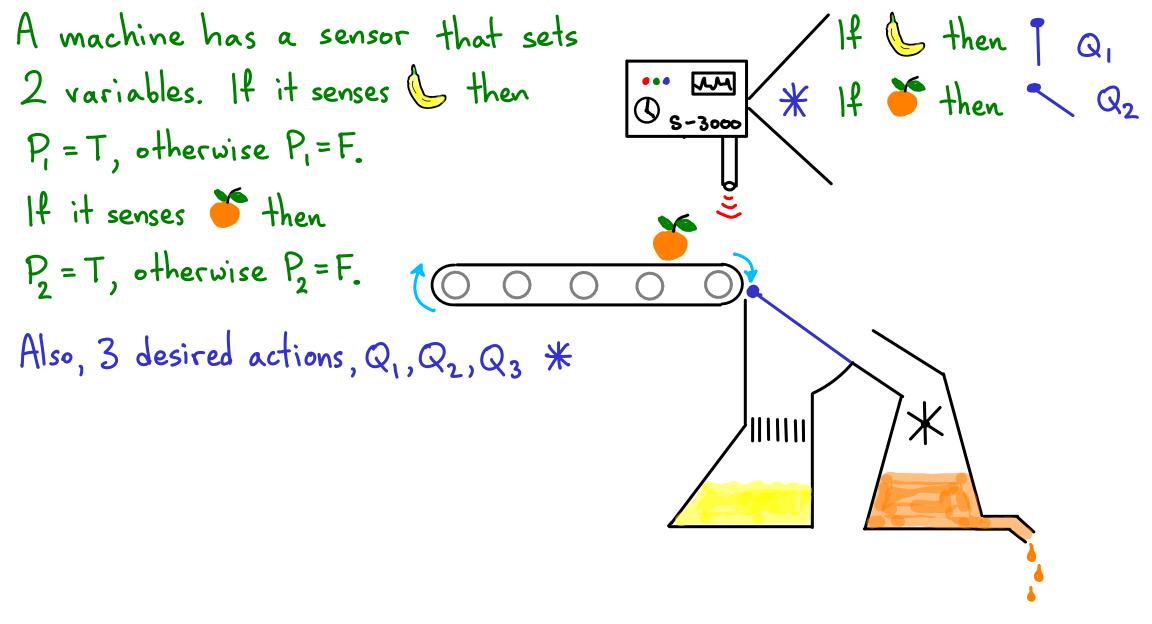

P

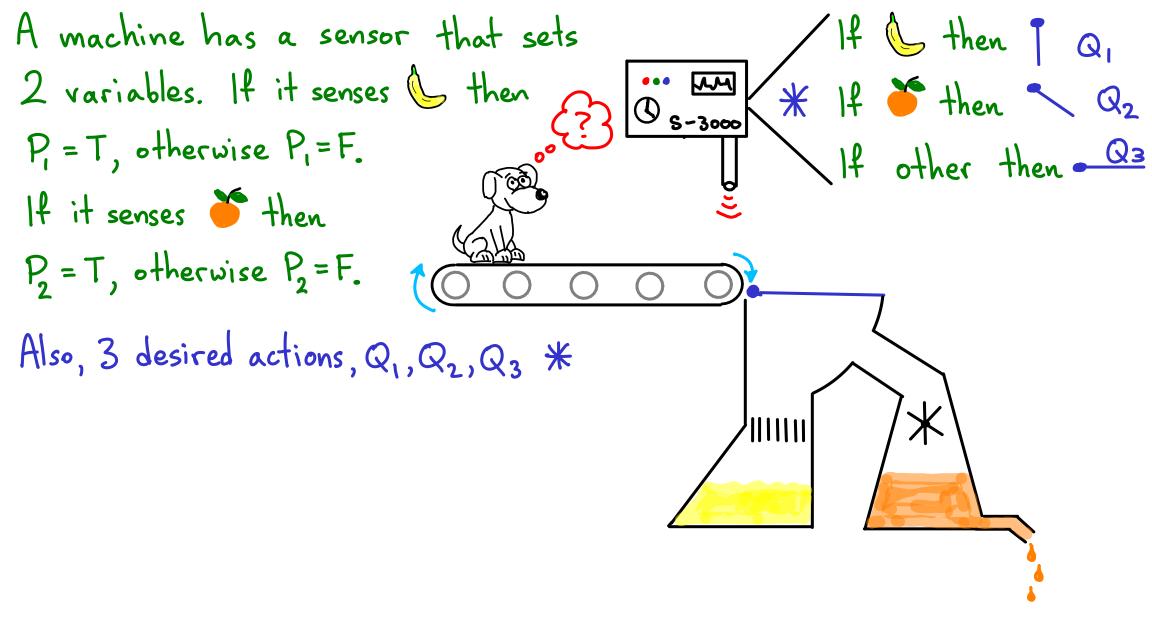

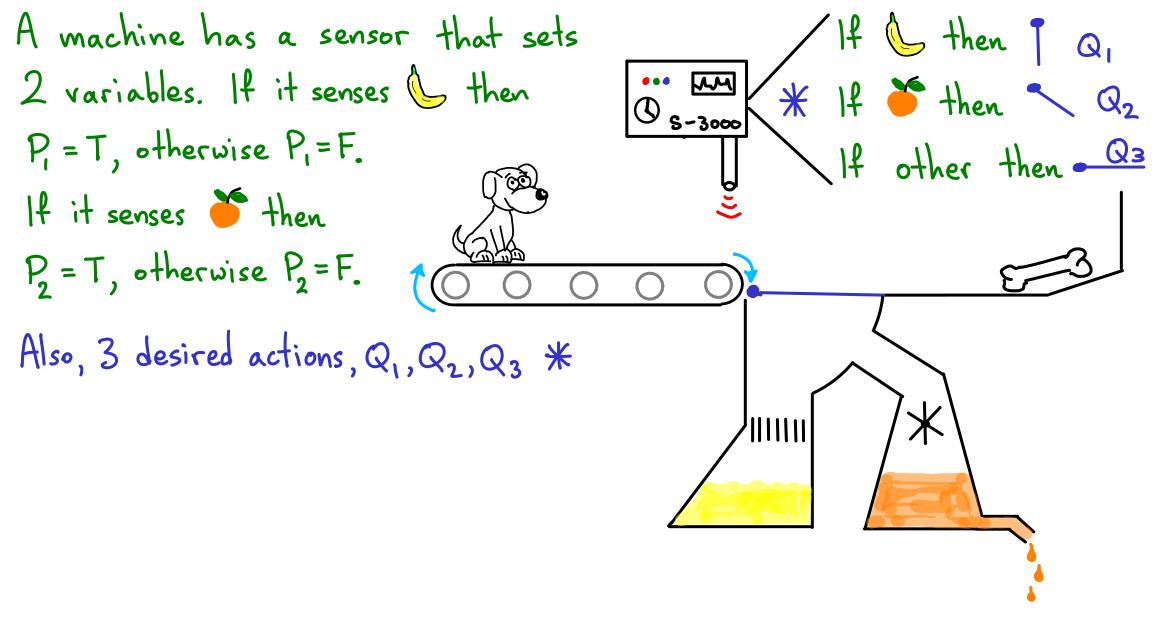

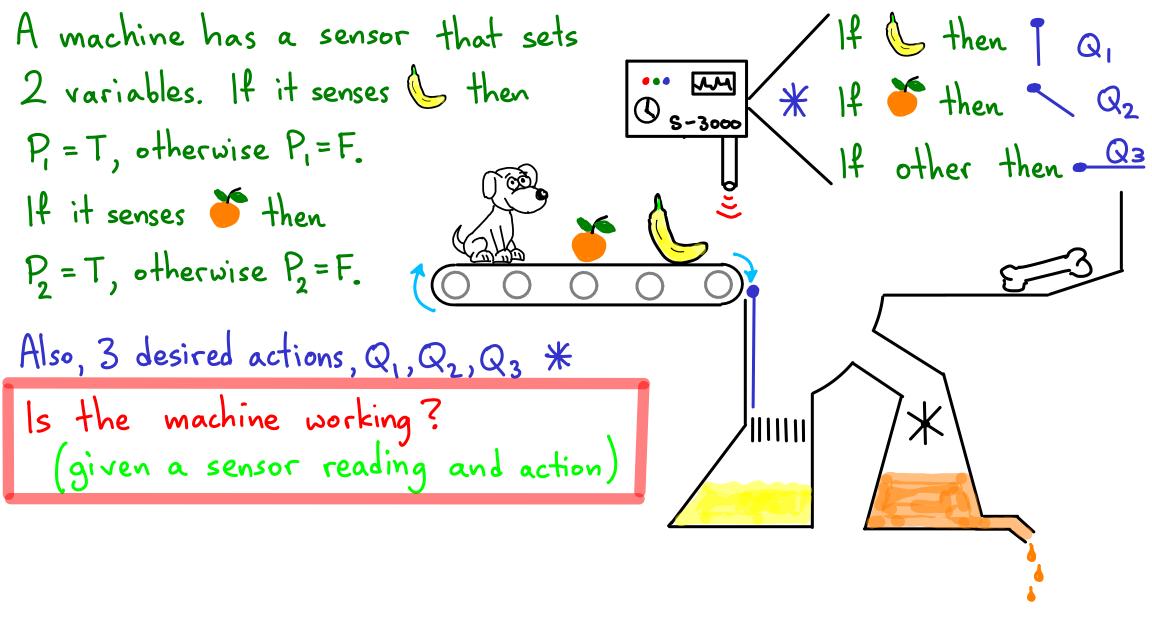

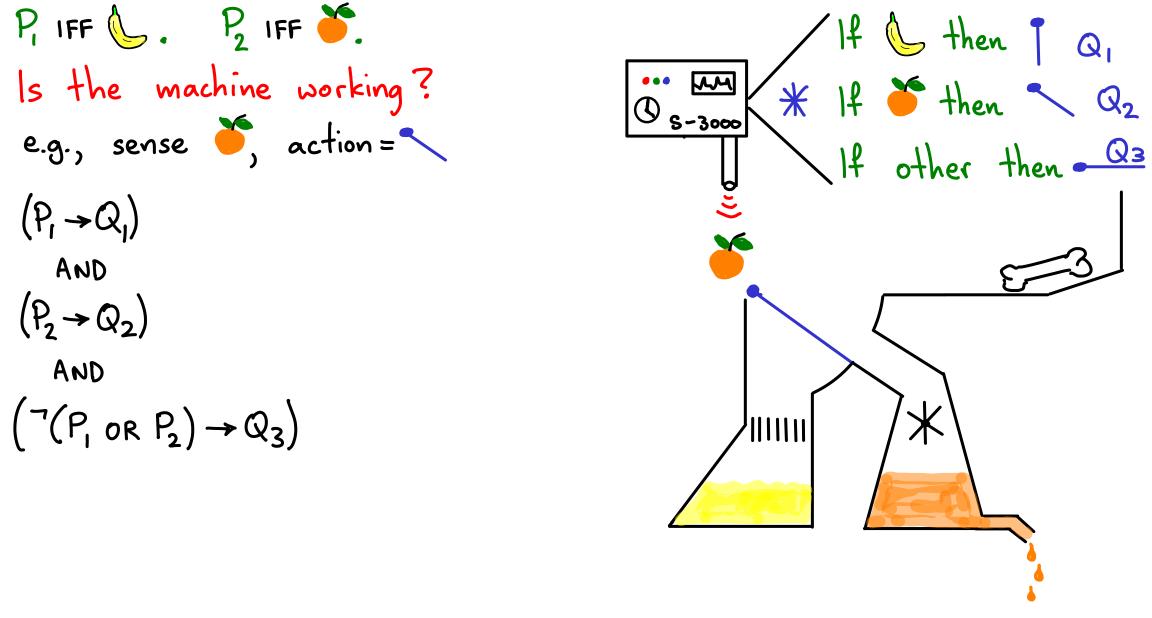

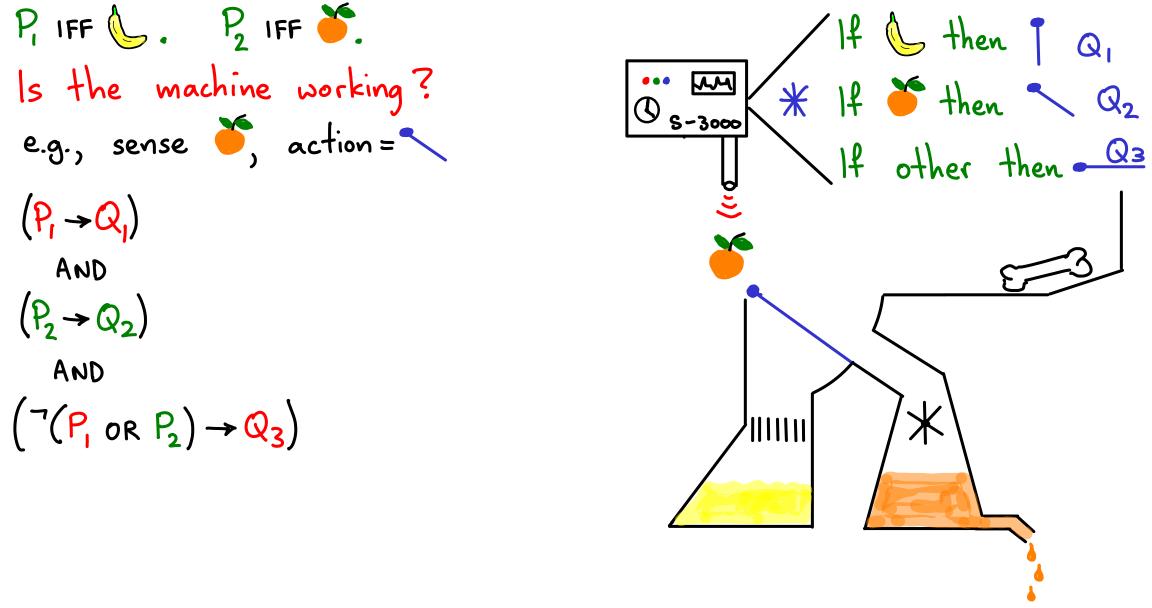

A machine has a sensor that sets If then | Q * If * then \ Q2 2 variables. If it senses & then P = T, otherwise P = F. If other then - Q3 If it senses then $P_2 = T$, otherwise $P_2 = F$. Also, 3 desired actions, Q1,Q2,Q3 * Is the machine working? (given a sensor reading and action) > Evaluate: $(P_1 \rightarrow Q_1)$ AND $(P_2 \rightarrow Q_2)$ AND $(^7(P_1 \text{ or } P_2) \rightarrow Q_3)$

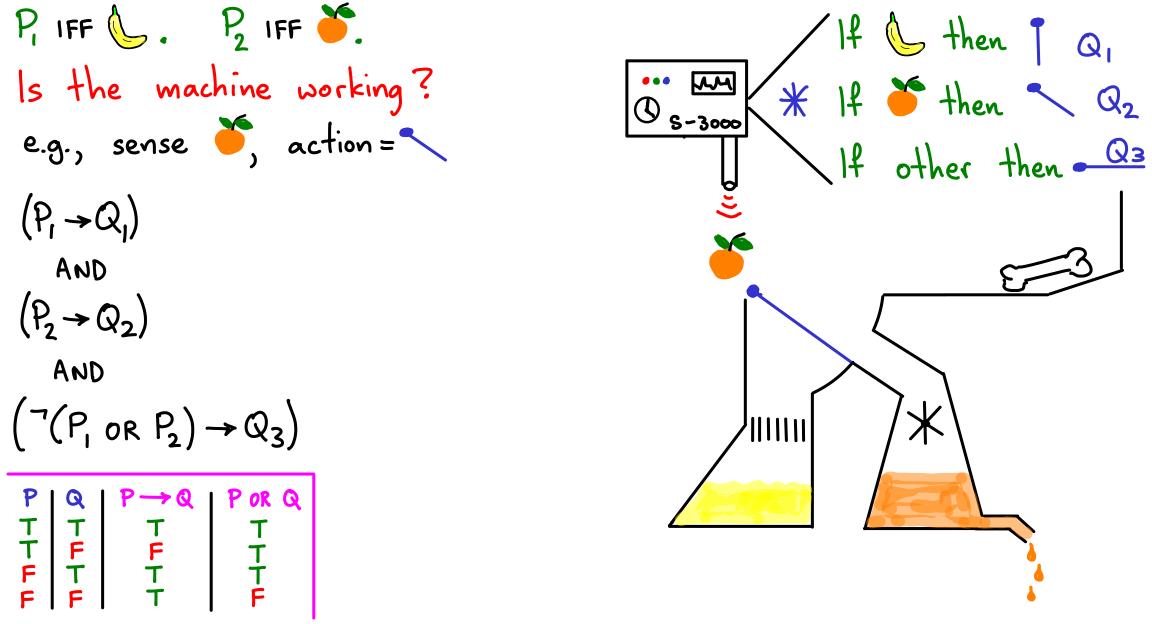

P, IFF . P, IFF . # If then Q₁

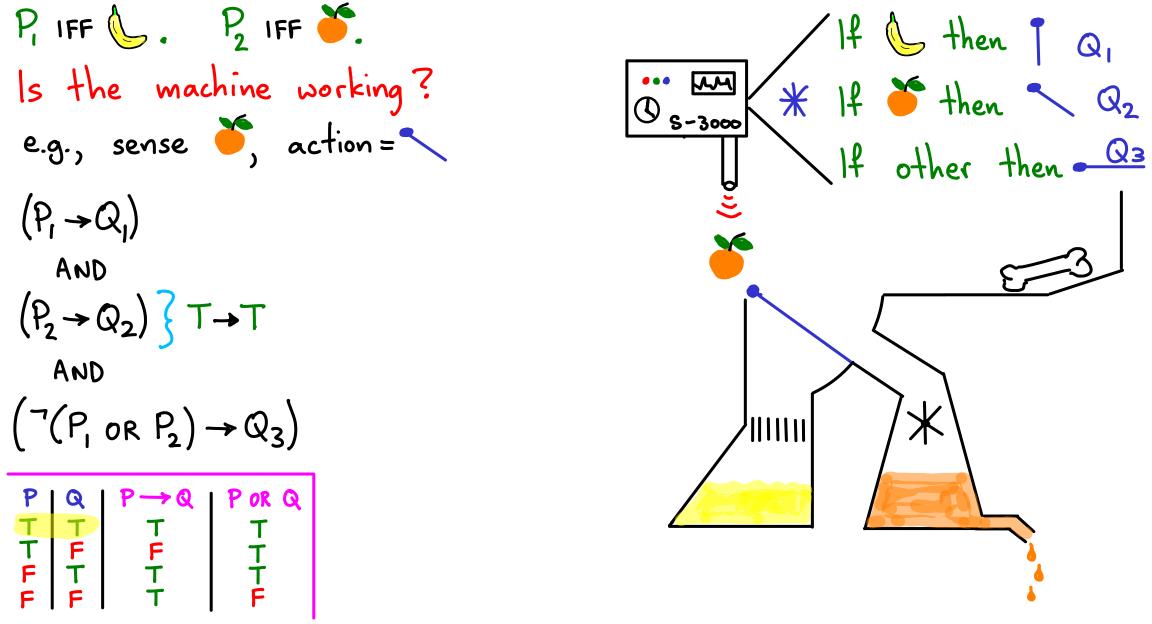

If then Q₂

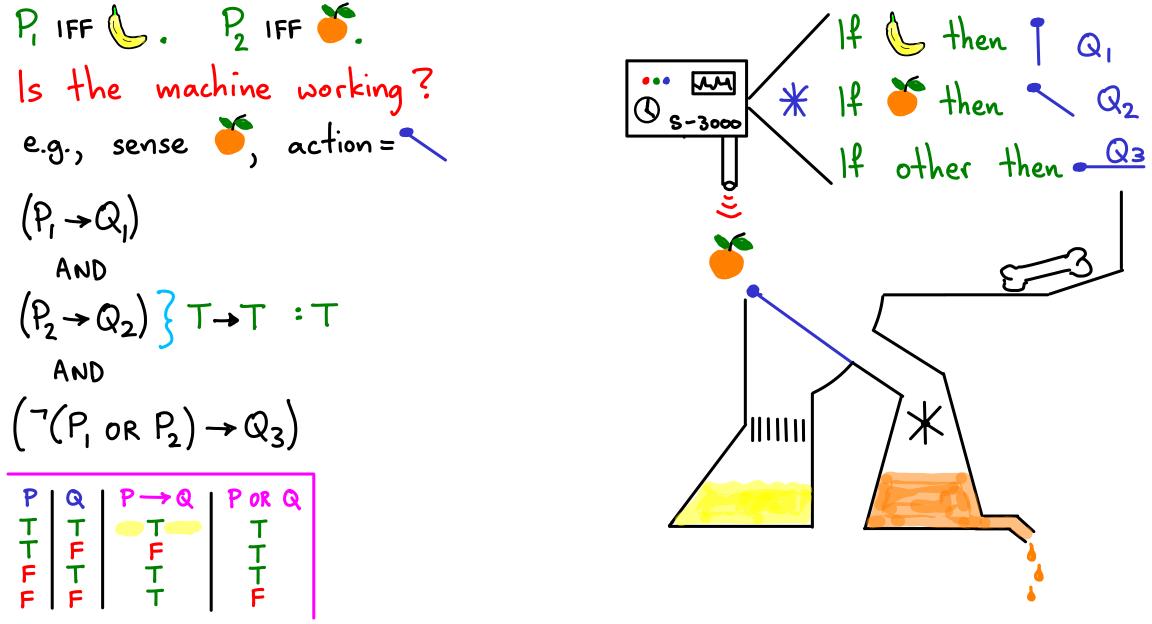

If other then Q₃ Is the machine working? $(P_1 \rightarrow Q_1)$ AND $(P_2 \rightarrow Q_2)$ AND $(^{7}(P_1 \text{ or } P_2) \rightarrow Q_3)$

B OR B (Shakespeare?)

B or B

B	⁷ B	B OR B
7	Т	T
F	T	T

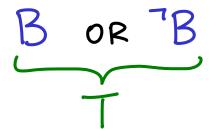

See also: tautology

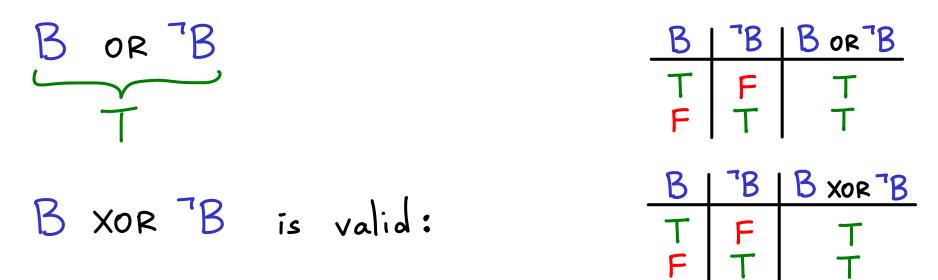

B	⁷ B	BorB
1	Т	T
F	T	T

B XOR B ... valid?

B	⁷ B	B or B
1 -	IП	Ţ
F	T	T

B	⁷ B	B XOR B
ㅠᅱ	Н Н	ΗH

If you're asked: "do you want cake now or later?" ...

B XOR B is valid:

If you're asked: "do you want cake now or later?" ... just say YES

Also works with: "do you want cake or ice cream?"

If a logic formula can be T then it is satisfiable

If a logic formula can be T then it is satisfiable

P is satisfiable IFF 7P is not valid

We have seen that a valid formula (tautology) can be simplified

Let's look at some more ways to simplify logic (formulas)

 $F AND A \longleftrightarrow F$ $T OR A \longleftrightarrow T$

claim: Can replace A > B with 7A or B

Can replace A→B with 7A or B

Can replace A→B with 7A or B

Can replace $A \leftrightarrow B$ with $(A \rightarrow B)$ AND $(B \rightarrow A)$

Can replace A→B with 7A or B

Can replace $A \leftrightarrow B$ with $(A \rightarrow B)$ AND $(B \rightarrow A)$, then $(^7A \text{ or } B)$ AND $(^7B \text{ or } A)$

Can replace A→B with 7A or B

Can replace $A \leftrightarrow B$ with $(A \rightarrow B)$ AND $(B \rightarrow A)$, then $(^7A \text{ or } B)$ AND $(^7B \text{ or } A)$

Can replace A XORB with (A ORB) AND 7(A AND B)

Can replace A→B with 7A or B

Can replace A↔B with (A→B) AND (B→A), then

(7A OR B) AND (7B OR A)

Can replace A XORB with (A ORB) AND 7(A AND B)

So we can get everything in terms of AND, OR, NOT.

Next we see several rules that can help to simplify/modify further

A AND B \iff B AND A

A OR B \iff B OR A

commutativity

A AND B \iff B AND A

A OR B \iff B OR A

 $(A AND B) AND C \leftrightarrow A AND (B AND C)$

commutativity

e.q., (A OR C) AND (A OR D) AND (B OR C OR D) We can write any propositional formula like this. e.g., A AND (B OR C) A | B | C | A AND (B OR C) Fill in entire truth table — Find all rows in table where formula is F. Want ALL of these rows to NOT be satisfied: (A or B or c) AND (A OR B OR C)

CONJUNCTIVE FORM "an AND of ORs"

What we got was actually DISJUNCTIVE NORMAL FORM. CONJUNCTIVE NORMAL FORM Every variable is present in each term within parentheses.

Source: MCS

Other sources use "CNF" and "DNF" without this requirement

What we got was actually DISJUNCTIVE NORMAL FORM.

& CONJUNCTIVE NORMAL FORM.

Every variable is present in each term within parentheses.

Why do we care about this?

This standardization can help proof automation (for validity, satisfiability)

You could also check if two formulas are equivalent, by getting them into the same "canonical" form

Source: MCS

Other sources use "CNF" and "DNF" without this requirement

What we got was actually DISJUNCTIVE NORMAL FORM CONJUNCTIVE NORMAL FORM

Every variable is present in each term within parentheses.

We can often simplify DNF, CNF

(A AND B AND C) OR (A AND B AND C) OR (A AND B AND C) (A AND B)

OR (A AND C)

What we got was actually DISJUNCTIVE NORMAL FORM CONJUNCTIVE NORMAL FORM Every variable is present in each term within parentheses. We can often simplify DNF, CNF (A AND B AND C) OR (A AND B AND C)

			e.g.,		
Α	В	C	Α	AND (BORC)	
1-1-1	1 1 1	THH		TTT	

OR (A AND B AND C)

(A AND B)

OR (A AND C)
