

Note to other teachers and users of these slides.  
Andrew would be delighted if you found this source material useful in giving your own lectures. Feel free to use these slides verbatim, or to modify them to fit your own needs. PowerPoint originals are available. If you make use of a significant portion of these slides in your own lecture, please include this message, or the following link to the source repository of Andrew's tutorials: <http://www.cs.cmu.edu/~aym/tutorials>. Comments and corrections gratefully received.

# Bayes Net Learning

Ronald J. Williams  
CSG220  
Spring 2007

A very slightly modified version of  
the Andrew Moore tutorial  
*Bayes Net Structure Learning*

## Reminder: A Bayes Net

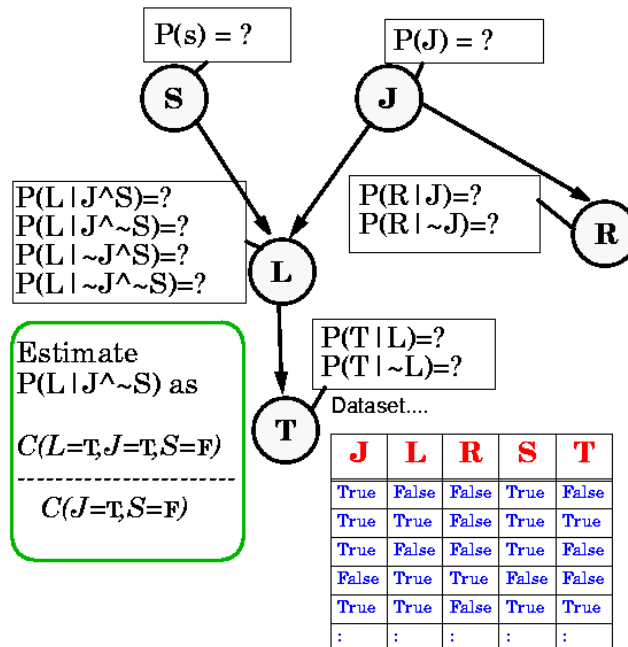

Bayes Net Learning: Slide 2

## Two Forms of Bayes Net Learning from Data

- Given structure, determine probability tables
  - Straightforward
- Determine the structure as well as the probability tables
  - Much harder
  - Involves trying to estimate when conditional independence is or is not likely based on the data
  - Also requires estimating the probability tables
  - May also involve adding new nodes

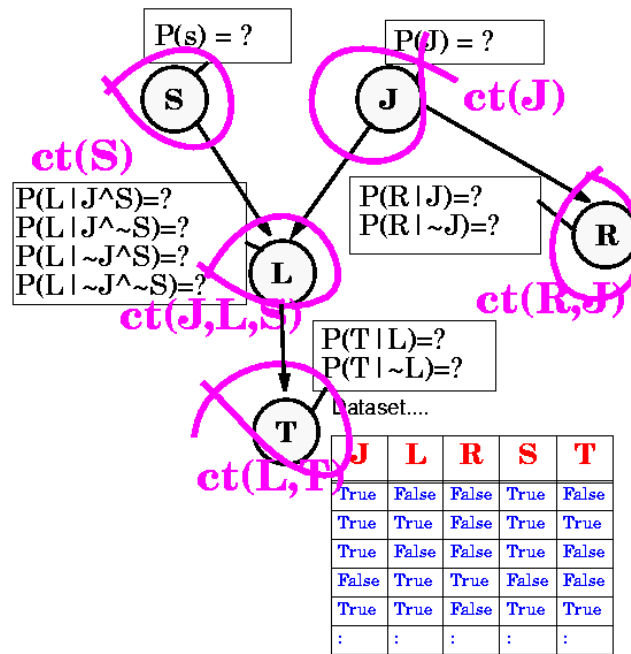

Bayes Net Learning: Slide 3

## Estimating Probability Tables

Bayes Net Learning: Slide 4

## Estimating Probability Tables

Bayes Net Learning: Slide 5

## Scoring a structure

$$\text{Score} = -\frac{N_{\text{params}}}{2} \log R + R \sum_{j=1}^m \sum_{k=1}^{\left( \begin{smallmatrix} \text{num combinations} \\ \text{of parent values} \end{smallmatrix} \right)} \sum_{v=1}^{\text{arity of } X_j} P(V_k) P(X_j = v | V_k) \log P(X_j = v | V_k)$$

N. Friedman and Z. Yakhini, On the sample complexity of learning Bayesian networks, Proceedings of the 12th conference on Uncertainty in Artificial Intelligence, Morgan Kaufmann, 1996

Bayes Net Learning: Slide 6

## Scoring a structure

Number of non-redundant parameters defining the net

#Attributes

#Records

Sums over all the rows in the probability table for  $X_j$

The parent values in the  $k$ 'th row of  $X_j$ 's probability table

$$\text{Score} = -\frac{N_{\text{params}}}{2} \log R + R \sum_{j=1}^m \sum_{k=1}^{\left(\begin{smallmatrix} \text{num combinations} \\ \text{of parent values} \end{smallmatrix}\right)} \sum_{v=1}^{\left(\text{arity of } X_j\right)} \underbrace{P(V_k)} \underbrace{P(X_j = v | V_k)} \log \underbrace{P(X_j = v | V_k)}$$

All these values estimated from data

Bayes Net Learning: Slide 7

## Scoring a structure

This is called a BIC (Bayes Information Criterion) estimate

This part is a penalty for too many parameters

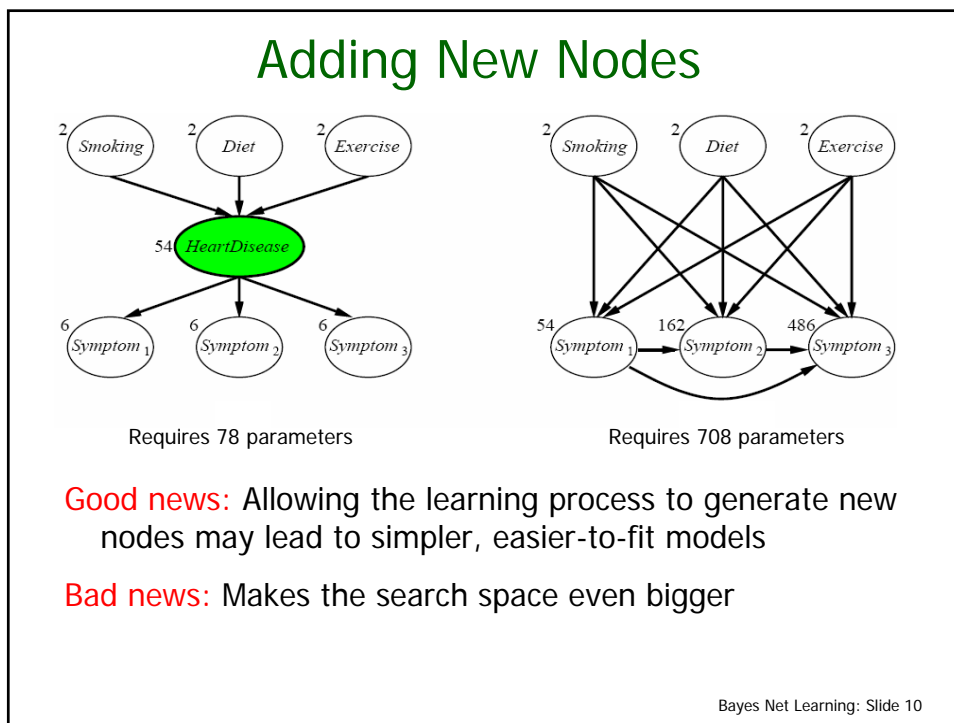

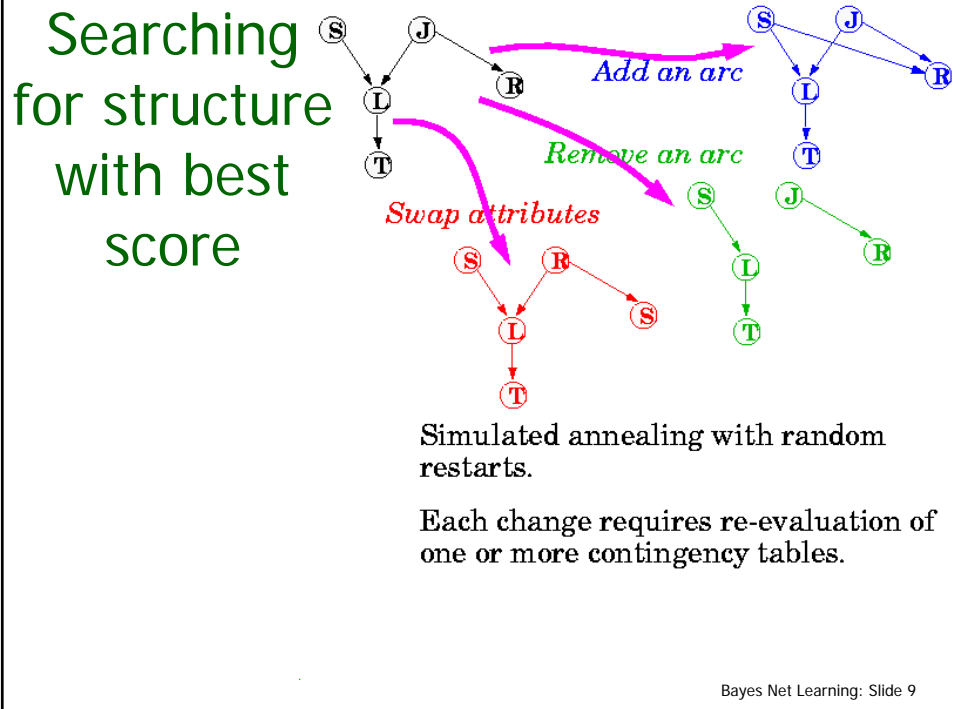

This part is the training set log-likelihood

BIC asymptotically tries to get the structure right. (There's a lot of heavy emotional debate about whether this is the best scoring criterion)

$$\text{Score} = -\frac{N_{\text{params}}}{2} \log R + R \sum_{j=1}^m \sum_{k=1}^{\left(\begin{smallmatrix} \text{num combinations} \\ \text{of parent values} \end{smallmatrix}\right)} \sum_{v=1}^{\left(\text{arity of } X_j\right)} \underbrace{P(V_k)} \underbrace{P(X_j = v | V_k)} \log \underbrace{P(X_j = v | V_k)}$$

All these values estimated from data

Bayes Net Learning: Slide 8

## What you should know

- That there exist methods for trying to learn Bayes nets from data

Bayes Net Learning: Slide 11
