

---

# Knowledge-based recommendation

# Basic I/O Relationship

---

# Why do we need knowledge-based recommendation?

---

- **Products with low number of available ratings**

- **Time span plays an important role**
  - five-year-old ratings for computers
  - user lifestyle or family situation changes
- **Customers want to define their requirements explicitly**
  - "the color of the car should be black"

# Knowledge-based recommender systems

---

- **Constraint-based**
  - based on explicitly defined set of recommendation rules
  - fulfill recommendation rules
- **Case-based**
  - based on different types of similarity measures
  - retrieve items that are similar to specified requirements
- **Both approaches are similar in their **conversational** recommendation process**
  - users specify the requirements
  - systems try to identify solutions
  - if no solution can be found, users change requirements

# Constraint-based recommender systems

---

- **Knowledge base**

- usually mediates between user model and item properties
- variables
  - user model features (requirements), Item features (catalogue)
- set of constraints
  - logical implications (IF user requires A THEN proposed item should possess feature B)
  - hard and soft/weighted constraints
  - solution preferences

- **Derive a set of recommendable items**

- fulfilling set of applicable constraints
- applicability of constraints depends on current user model
- explanations – transparent line of reasoning

## Constraint-based recommendation tasks

---

- **Find a set of user requirements such that a subset of items fulfills all constraints**
  - ask user which requirements should be relaxed/modified such that some items exist that do not violate any constraint
  
- **Find a subset of items that satisfy the maximum set of weighted constraints**
  - similar to find a maximally succeeding subquery (XSS)
  - all proposed items have to fulfill the same set of constraints
  - compute relaxations based on predetermined weights
  
- **Rank items according to weights of satisfied soft constraints**
  - rank items based on the ratio of fulfilled constraints
  - does not require additional ranking scheme

# Constraint-based recommendation problem

---

- Select items from this catalog that match the user's requirements

id	price(€)	mpix	opt-zoom	LCD-size	movies	sound	waterproof
P <sub>1</sub>	148	8.0	4×	2.5	no	no	yes
P <sub>2</sub>	182	8.0	5×	2.7	yes	yes	no
P <sub>3</sub>	189	8.0	10×	2.5	yes	yes	no
P <sub>4</sub>	196	10.0	12×	2.7	yes	no	yes
P <sub>5</sub>	151	7.1	3×	3.0	yes	yes	no
P <sub>6</sub>	199	9.0	3×	3.0	yes	yes	no
P <sub>7</sub>	259	10.0	3×	3.0	yes	yes	no
P <sub>8</sub>	278	9.1	10×	3.0	yes	yes	yes

- User's requirements can, for example, be
  - "the price should be lower than 300 €"
  - "the camera should be suited for sports photography"

## Constraint satisfaction problem (CSP)

---

- A knowledge-based RS with declarative knowledge representation

$$CSP (X_I \cup X_U, D, SRS \cup KB \cup I)$$

- **Def.**

- $X_I, X_U$ : Variables describing product and user model with domain D
- KB: Knowledge base with domain restrictions (e.g. **if** purpose=*on travel* **then** lower focal length < 28mm)
- SRS: Specific requirements of user (e.g. purpose = *on travel*)
- I: Product catalog

- **Solution: Assignment tuple**  $\theta \forall x \in X_I (x = v) \in \theta \wedge v \in dom(x)$

*s.t.*  $SRS \cup KB \cup I \cup \theta$  **is satisfiable**

## Conjunctive query

---

- **Different from a constraint solver**
  - it is not to find valid instantiations for a CSP
- **Conjunctive query is executed in the item catalog**
  - a conjunctive database query
  - a set of selection criteria that are connected conjunctively
- **$\sigma[\text{criteria}](P)$** 
  - $P$ : product assortment
  - example:  $\sigma[\text{mpix} \geq 10, \text{price} < 300](P) = \{p4, p7\}$

## Interacting with constraint-based recommenders

---

- **The user specifies his or her initial preferences**
  - all at once or
  - incrementally in a wizard-style
  - interactive dialog
- **The user is presented with a set of matching items**
  - with explanation as to why a certain item was recommended
- **The user might revise his or her requirements**
  - see alternative solutions
  - narrow down the number of matching items

# Defaults

---

- **Support customers to choose a reasonable alternative**
  - unsure about which option to select
  - simply do not know technical details
  
- **Type of defaults**
  - static defaults
  - dependent defaults
  - derived defaults
  
- **Selecting the next question**
  - most users are not interested in specifying values for all properties
  - identify properties that may be interesting for the user

## Unsatisfied requirements

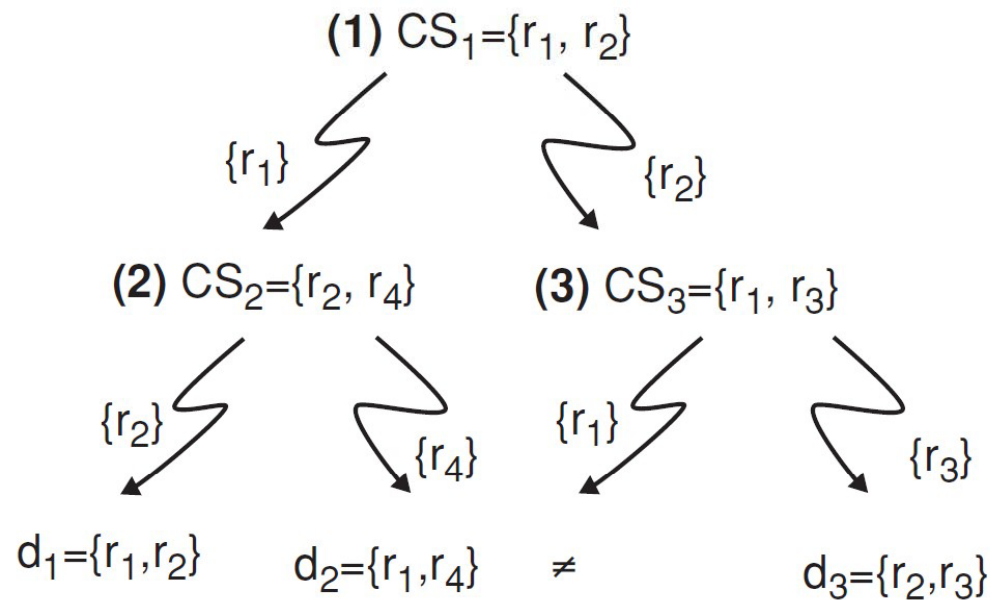

---

- **"no solution could be found"**
- **Constraint relaxation**
  - the goal is to identify relaxations to the original set of constraints
  - relax constraints of a recommendation problem until a corresponding solution has been found
- **Users could also be interested in repair proposals**
  - recommender can calculate a solution by adapting the proposed requirements

## Deal with unsatisfied requirements

---

- Calculate diagnoses for unsatisfied requirements

- The diagnoses derived from the conflict sets  $\{CS_1, CS_2, CS_3\}$  are  $\{d_1: \{r_1, r_2\}, d_2: \{r_1, r_4\}, d_3: \{r_2, r_3\}\}$
-

# QuickXPlain

---

- Calculate conflict sets

Algorithm 4.1 QuickXPlain( $P$ ,  $REQ$ )

Input: trusted knowledge (items)  $P$ ; Set of requirements  $REQ$

Output: minimal conflict set  $CS$

if  $\sigma_{[REQ]}(P) = \emptyset$  or  $REQ = \emptyset$  then return  $\emptyset$

else return  $QX'(P, \emptyset, \emptyset, REQ)$ ;

Function  $QX'(P, B, \Delta, REQ)$

if  $B = \emptyset$  and  $\sigma_{[B]}(P) = \emptyset$  then return  $\emptyset$ ;

if  $REQ = \{r\}$  then return  $\{r\}$ ;

let  $\{r_1, \dots, r_n\} = REQ$ ;

let  $k$  be  $n/2$ ;

$REQ_1 \leftarrow r_1, \dots, r_k$  and  $REQ_2 \leftarrow r_{k+1}, \dots, r_n$ ;

$\Delta_2 \leftarrow QX(P, B \cup REQ_1, REQ_1, REQ_2)$ ;

$\Delta_1 \leftarrow QX(P, B \cup \Delta_2, \Delta_2, REQ_1)$ ;

return  $\Delta_1 \cup \Delta_2$ ;

---

# Example of QuickXPlain

id	Price(€)	mpix	opt-zoom	LCD-size	movies	sound	waterproof
P <sub>1</sub>	148	8.0	4x	2.5	no	no	yes
P <sub>2</sub>	182	8.0	5x	2.7	yes	yes	no
P <sub>3</sub>	189	8.0	10x	2.5	yes	yes	no
P <sub>4</sub>	196	10.0	12x	2.7	yes	no	yes
P <sub>5</sub>	151	7.1	3x	3.0	yes	yes	no
P <sub>6</sub>	199	9.0	3x	3.0	yes	yes	no
P <sub>7</sub>	259	10.0	3x	3.0	yes	yes	no
P <sub>8</sub>	278	9.1	10x	3.0	yes	yes	yes

- **REQ = {r1:price≤150, r2:opt-zoom=5x, r3:sound=yes, r4:waterproof=yes}**

# Repairs for unsatisfied requirements

---

- Identify possible adaptations
- Or query the product table  $P$  with  $\pi[\text{attributes}(d)]\sigma[\text{REQ}-d](P)$ 
  - $\pi[\text{attributes}(d1)]\sigma[\text{REQ}-d1](P) = \{\text{price}=278, \text{opt-zoom}=10\times\}$
  - $\pi[\text{attributes}(d2)]\sigma[\text{REQ}-d2](P) = \{\text{price}=182, \text{waterproof}=\text{no}\}$
  - $\pi[\text{attributes}(d3)]\sigma[\text{REQ}-d3](P) = \{\text{opt-zoom}=4\times, \text{sound}=\text{no}\}$

repair	price(€)	opt-zoom	sound	waterproof
Rep <sub>1</sub>	278	10×	√	√
Rep <sub>2</sub>	182	√	√	no
Rep <sub>3</sub>	√	4×	no	√

# Ranking the items

---

- **Multi-attribute utility theory**
  - each item is evaluated according to a predefined set of dimensions that provide an aggregated view on the basic item properties
- ***E.g. quality and economy are dimensions in the domain of digital cameras***

id	value	quality	economy
price	≤250	5	10
	>250	10	5
mpix	≤8	4	10
	>8	10	6
opt-zoom	≤9	6	9
	>9	10	6
LCD-size	≤2.7	6	10
	>2.7	9	5
movies	Yes	10	7
	no	3	10
sound	Yes	10	8
	no	7	10
waterproof	Yes	10	6
	no	8	10

# Item utility for customers

---

- Customer specific interest

Customer	quality	economy
Cu <sub>1</sub>	80%	20%
Cu <sub>2</sub>	40%	60%

- Calculation of Utility*

quality	economy	cu <sub>1</sub>	cu <sub>2</sub>
P <sub>1</sub> Σ(5,4,6,6,3,7,10) = 41	Σ (10,10,9,10,10,10,6) = 65	45.8 [8]	55.4 [6]
P <sub>2</sub> Σ(5,4,6,6,10,10,8) = 49	Σ (10,10,9,10,7,8,10) = 64	52.0 [7]	58.0 [1]
P <sub>3</sub> Σ(5,4,10,6,10,10,8) = 53	Σ (10,10,6,10,7,8,10) = 61	54.6 [5]	57.8 [2]
P <sub>4</sub> Σ(5,10,10,6,10,7,10) = 58	Σ (10,6,6,10,7,10,6) = 55	57.4 [4]	56.2 [4]
P <sub>5</sub> Σ(5,4,6,10,10,10,8) = 53	Σ (10,10,9,6,7,8,10) = 60	54.4 [6]	57.2 [3]
P <sub>6</sub> Σ(5,10,6,9,10,10,8) = 58	Σ (10,6,9,5,7,8,10) = 55	57.4 [3]	56.2 [5]
P <sub>7</sub> Σ(10,10,6,9,10,10,8) = 63	Σ (5,6,9,5,7,8,10) = 50	60.4 [2]	55.2 [7]
P <sub>8</sub> Σ(10,10,10,9,10,10,10) = 69	Σ (5,6,6,5,7,8,6) = 43	63.8 [1]	53.4 [8]

---

# Case-based recommender systems

---

- Items are retrieved using similarity measures
- Distance similarity

$$\text{similarity}(p, REQ) = \frac{\sum_{r \in REQ} w_r * \text{sim}(p, r)}{\sum_{r \in REQ} w_r}$$

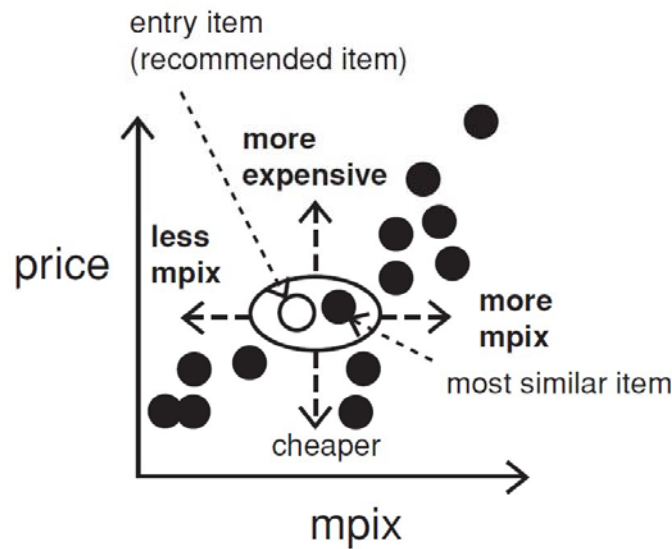

- **Def.**
  - $\text{sim}(p, r)$  expresses for each item attribute value  $\phi_r(p)$  its distance to the customer requirement  $r \in REQ$ .
  - $w_r$  is the importance weight for requirement  $r$
- **In real world, customer would like to**
  - maximize certain properties. i.e. resolution of a camera, "more is better"(MIB)
  - minimize certain properties. i.e. price of a camera, "less is better"(LIB)

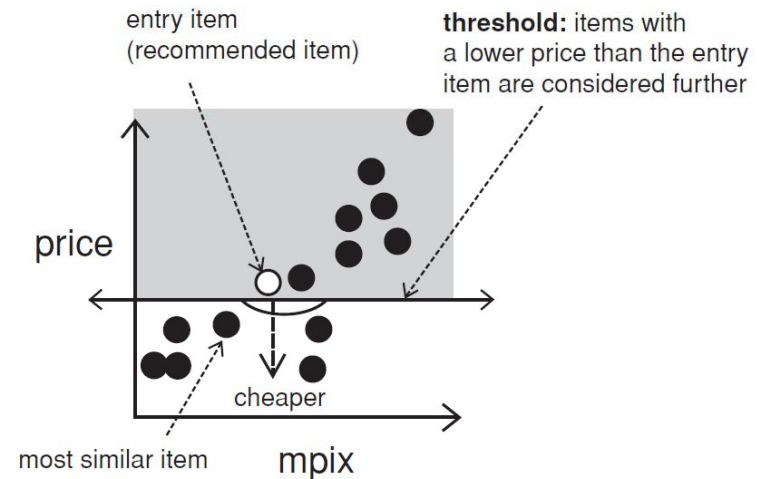

# Interacting with case-based recommenders

---

- Customers maybe not know what they are seeking
- Critiquing is an effective way to support such navigations
- Customers specify their change requests (*price or mpix*) that are not satisfied by the current item (*entry item*)

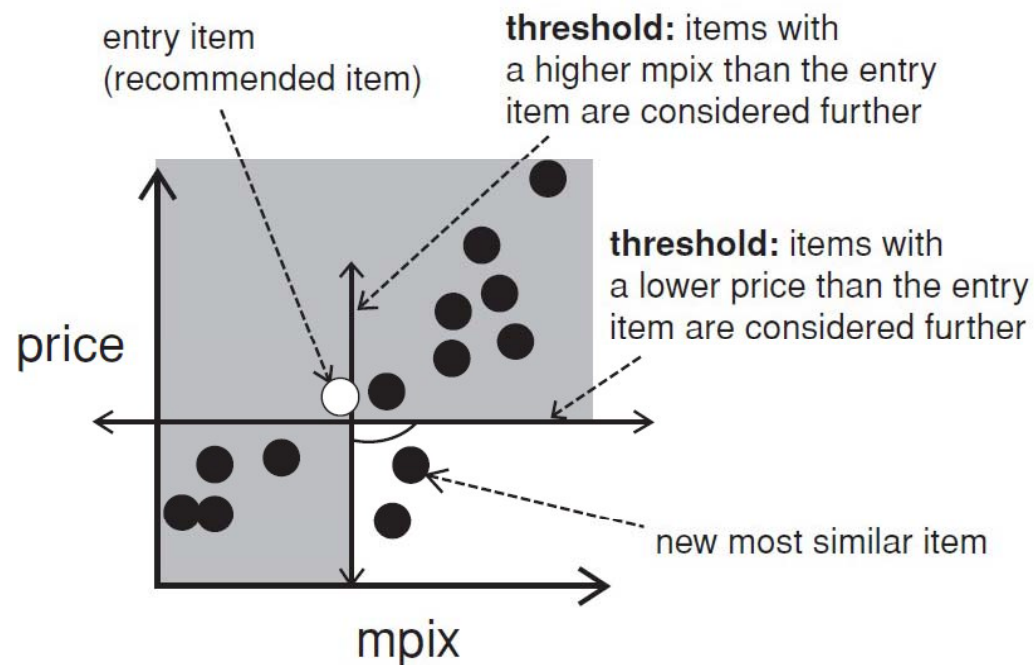

*Critique on price*

## Compound critiques

---

- Operate over multiple properties can improve the efficiency of recommendation dialogs

# Dynamic critiques

---

- Association rule mining
- Basic steps for dynamic critiques
  - $q$ : initial set of requirements
  - $CI$ : all the available items
  - $K$ : maximum number of compound critiques
  - $\sigma_{min}$ : minimum support value for calculated association rules.

Algorithm 4.4 DynamicCritiquing( $q, CI$ )  
Input: Initial user query  $q$ ; Candidate items  $CI$ ;  
number of compound critiques per cycle  $k$ ;  
minimum support for identified association rules  $\sigma_{min}$

```
procedure DynamicCritiquing( $q, CI, k, \sigma_{min}$ )
repeat
 $r \leftarrow$  ItemRecommend( $q, CI$ );
 $CC \leftarrow$  CompoundCritiques( $r, CI, k, \sigma_{min}$ );
 $q \leftarrow$  UserReview( $r, CI, CC$ );
until empty( $q$ )
end procedure
```

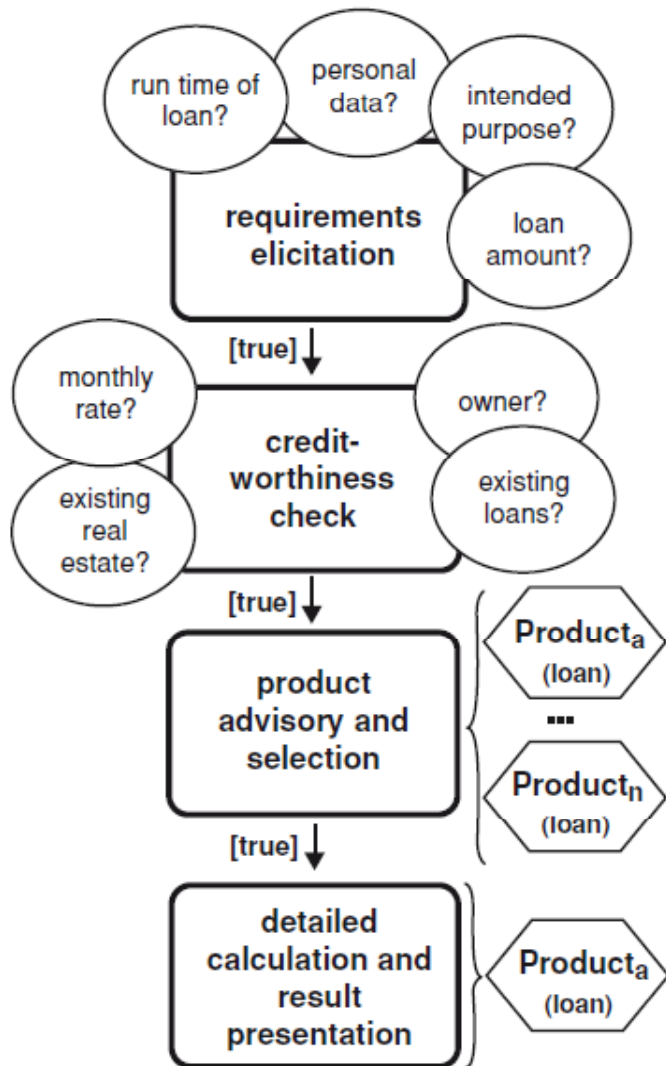

```
procedure ItemRecommend( $q, CI$ )
 $CI \leftarrow \{ci \in CI: \text{satisfies}(ci, q)\}$ ;
 $r \leftarrow$  mostsimilar( $CI, q$ );
return  $r$ ;
end procedure
```

```
procedure UserReview( $r, CI, CC$ )
 $q \leftarrow$  critique( $r, CC$ );
 $CI \leftarrow CI - r$ ;
return  $q$ ;
end procedure
```

```
procedure CompoundCritiques( $r, CI, k, \sigma_{min}$ )
 $CP \leftarrow$  CritiquePatterns( $r, CI$ );
 $CC \leftarrow$  Apriori( $CP, \sigma_{min}$ );
 $SC \leftarrow$  SelectCritiques( $CC, k$ );
return  $SC$ ;
end procedure
```

## Example: sales dialogue financial services

---

- **In the financial services domain**
  - sales representatives do not know which services should be recommended
  - improve the overall productivity of sales representatives
- **Resembles call-center scripting**
  - best-practice sales dialogues
  - states, transitions with predicates
- **Research results**
  - support for KA and validation
    - node properties (reachable, extensible, deterministic)

# Example software: VITA sales support

VITA - Virtuelle Beratung Kombiprodukte

Eingelogg: Administrator

Bedarfsermittlung → Bonitätsprüfung → Bausparen → Ergebnis

**recommendation process: requirements identification, creditworthiness check, ... , result presentation**

**current user of VITA**

**one product recommendation**

**requirements articulated by the customer**

**explanation as to why the product is recommended**

**further details regarding product**

**Kundenanforderungen:**

- **Kreditsumme:** 1,00 (in Mio HUF)
- **Kundenalter:** 37 Jahre
- **Auszahlungszeitpunkt:** 2007.03.01
- **Summe Monatsraten:** 20,000 HUF
- **Laufzeit:** 180 (in Monaten)
- **Verwendungszweck:** Um eine Neuwohnung zu kaufen
- **Kreditwährung:** in HUF
- **Bausparsumme:** 2.460.000 HUF

Daher wurden folgende Produkte ermittelt:

**Duo - gefördert - Staat. Zins**  
Értjük egymást.

<b>Kombiprodukt:</b>	1.259.008 HUF	<b>Anbieter:</b>	Erste Bank
<b>Bankdarlehen:</b>	1.577.379 HUF	<b>Zinssatz+Gebühr:</b>	4,49%+2,28%

## Example: Critiquing

*Find your  
Favourite restaurant*

In Vienna you chose:

+43 1 123 123 123    **Biergasthof**    30€-50€  
Local cuisine  
Mariahilferstrasse 123,  
1010 Wien

local food, central in the city, weekend brunch, room with a view,  
famous for beer, seasonal dishes, group bookings, open all day

For Graz we recommend:

+43 316 45 45 45    **Brauhof**    30€-50€  
Local cuisine  
Brauhoferstrasse 45,  
8023 Graz

local food, own beer, weekend lunch, open all day, private function room,  
famous for beer, seasonal dishes, group bookings, good transport connection

*Less \$\$*    *Nicer*    *Cuisine*    *More Quiet*

*Traditional*    *Creative*    *Livelier*

- **Similarity-based navigation in item space**
- **Compound critiques**
  - more efficient navigation than with unit critiques
  - mining of frequent patterns
- **Dynamic critiques**
  - only applicable compound critiques proposed
- **Incremental critiques**
  - considers history
- **Adaptive suggestions**
  - suggest items that allow to best refine user's preference model

# Summary

---

- **Knowledge-based recommender systems**

- constraint-based
- case-based

- **Limitations**

- cost of knowledge acquisition
  - from domain experts
  - from users
  - from web resources
- accuracy of preference models
  - very fine granular preference models require many interaction cycles
  - collaborative filtering models preference implicitly
- independence assumption can be challenged
  - preferences are not always independent from each other
